

Help with gearing

Posted by mcmotorsports - 26 Jun 2009 10:44

Is it possible to check the individual ratios of each gear without removing the transmission? There is some question about my transmission and the possibility of it being out of an "S". I am pretty confident that it is not, but want to make sure.

If you still have a speedo, you might be able to figure out the speed in gears, but it's a pretty subtle difference between S gearing, and regular 8V. A dyno would be more accurate. Why do you think it might be an "S" trans?

I don't think I have an 'S' trans, two other competitors think I do based on a recent video @ Road Atlanta. I got a feeling it is more about where I am shifting than it is what tranny I have.

how about traqmate or other gps system and do 3000 rpm in each gear ??? measure the tires and do the math.

The best thing is to check the tranny codes. The 944 S has different tranny code. This does not prevent someone from having swapped all the internals from an S into a non-S box, but that is a lot of work for no gain. It is possible someone swapped the NA box for the S box years ago since it may have been around when the original failed.

The only issue is tranny code is on the top of the box.

As for checking RPM... I don't know how that will work out. The raitos are different, but quite close so you may not be able to tell for sure.

After watching some other Road Atlanta videos I am pretty convinced that there is nothing wrong with my car and it is simply their shift points and lines are different than mine.
