Seat installation w/ ripped out bolt damage Posted by Jump07 - 30 May 2008 06:19
This morning one of the bolts holding down the front of my seat ripped right through the floorpan. Has this happened to anyone else?
I am hoping that it is repairable with welding another threaded bit on?
I am thinking this would be a good time to install my Kirkey seat. Has anyone welded their brackets directly to the floor?
What are my options here?
Thanks,
Jeremy

Having seen some 944 wreck pics, I would like to weld some reinforcement bars from the sill to the tunnel to mount my seat to at some point. The floor pan can fail with some types of impacts, which doesn't look pretty. Hanksville (cage builder, RM sponsor) did this type of reinforcement in Whit's Acura, and it looks like money well spent. That is common practice in rally car preparation too. Just my \$.02
Fine with me and ok in the rules as this is for safety not any competitive advantage.

Jeremy,

This can be repaired by welding. The was done on the #95 25 hours car, my #89 car and I believe Steve's #106 car.

TCDesign said this was more common than you might think.

They were some scraps I had laying around that seemed quite large. I figure the larger the better. As you can see the inboard side needed smaller backing plates due to where the lines run under the chassis. If you note the two goldish ones the are the sub belt mounts using hardware from the Schroth harness kit. I don't have a picture of the passenger's seat mounting, but for that I used a large plate about 2" by 12 or 14" long to back up the front and rear holes. Again this was stock I had on had and since my car was underweight (need ballast anyway) saving a few ounces was not an issue. I just use big fender washers because they were readily available at any hardware store.
Were the metal pieces just scraps you had laying around or were they specifically shaped?
Joe,

I'm interested in this.
Can you get some pictures of the reinforcement Hanksville did for the Acura?
Cullen or Chuck,
