

Lexan (polycarbonate) windshields, clarifications

Posted by cbuzzetti - 15 Mar 2013 05:42

I am looking to replace my windshield with Lexan but the Nasa CCR and Spec rules do not state minimum thickness or mounting requirements.

Some installs I have seen have the lexan just sitting in the original frame with exterior clips and nothing more. Others are riveted around the perimeter.

What is the recommended thickness?

What is the recommended mounting procedure?

I have been trying to buy one of the old Nascar windshields from Racingmetal for the past two months but cant seem to find one. Anyone have an alternate source?

Thanks,

=====

I have one I was keeping as a spare. It has one hole drilled toward the top offcenter toward the passenger side. Not in the field of vision.

It is a hardened outer layer with anti fog inner which are the most expensive. It will be trim to fit.

\$150+ shipping

Looks like \$100 but if it is less I will just charge what it costs. That is with FedEx Ground.

Yeah I figured it would be expensive. Let me think it over.

Thanks for getting back to me so quickly too!
