Need 30mm torsion bar reference measurement Posted by 944Racer72 - 24 Jan 2010 04:31
Since I'm converting from coilovers to 30mm torsion bars, I have no starting point for indexing.
Does anyone have a reference measurement for an unloaded suspension with 30 mm torsion bars? I have aluminum banana arms.
I realize that this measurement will be dependent on your final ride height etc but at least it will get me in the ballpark and I can play with it from there. Right now, I have no clue how far the 30mm bars will flex when loaded.
Thank you!
