

Dies off throttle/coming to a stop...

Posted by SamGrant951 - 02 Apr 2011 11:52

85.5 944 - just drove it for the first time around the neighborhood.

It dies without giving it some gas when cold, it will start up OK without giving it gas but then immed dies. I figured it was d/t ISV delete but its still under the intake and appears to be hooked up.

Once it warms up (5 min or so) it seems to idle OK, but coming off throttle to a hard stop/clutch in the rpms drop and it dies. Did it 3x times when I drove it prob less than 1-2 miles - kind of annoying.

I just replaced the vac lines last night so it shouldnt be that. My guess would be TPS, AFM? Once its warmed up the ISV should be irrelevant yes/no?

Anyone got a spare TPS/AFM I could buy to have a spare for this weekend just in case?

I can reach in and fire my turbo without driving it for 3 months and have it idle perfect, I want that!

thanks sam

Good deal on the TPS. Make sense it was the problem. The ISV should create nice smooth idle while install and I prefer to run one where ever possible.
